

# 1.2 Introduction to Transformations

You learned this once in middle school, but that was like a million years ago.

## Transformations

A transformation is a change in the location or size of a figure.

\_\_\_\_\_  
\_\_\_\_\_

\_\_\_\_\_  
\_\_\_\_\_

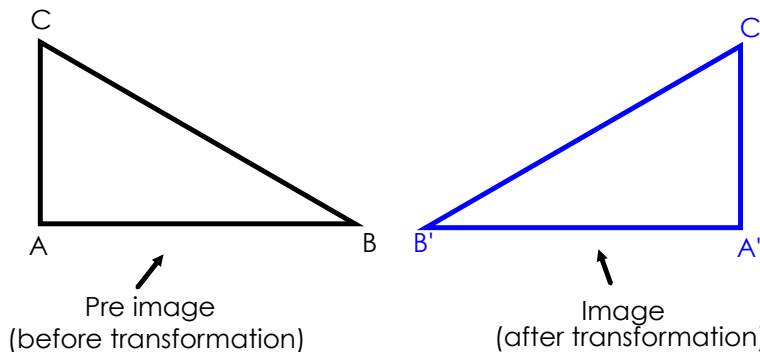

\_\_\_\_\_  
\_\_\_\_\_

\_\_\_\_\_  
\_\_\_\_\_

## Rigid Motions

A **rigid motion** is a transformation where the lengths of the sides and the angles of the figure stay the same

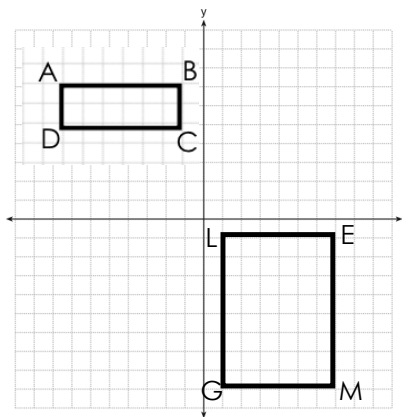

Is this an example of a rigid motion?

Yes, a \_\_\_\_\_ is a rigid motion because

\_\_\_\_\_  
\_\_\_\_\_

# Congruence Shapes

Shapes are congruent if **all corresponding angles** and all corresponding **side lengths** are the same

Two figures are congruent if there is a set of rigid transformations that map the figures onto each other

- 1.State the transformation that maps  $\triangle XYZ$  onto  $\triangle X'Y'Z'$
2. Explain why triangle  $\triangle XYZ$  is congruent to triangle  $\triangle X'Y'Z'$ .

A \_\_\_\_\_ is a rigid motion and rigid motions preserves side lengths and angle measures

- 1.State the transformation that maps  $\triangle CAT$  onto  $\triangle DOG$
2. Using the properties of rigid transformations, explain why triangle  $\triangle CAT$  is congruent to triangle  $\triangle DOG$ .

# Independent Practice

In each example, identify the transformation and state if it is a rigid motion or not.

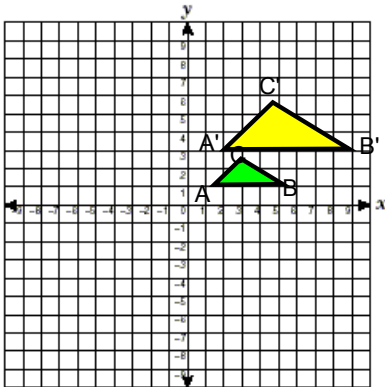

Transformation: \_\_\_\_\_

Is this a rigid motion? \_\_\_\_\_

Transformation: \_\_\_\_\_

Is this a rigid motion? \_\_\_\_\_

Transformation: \_\_\_\_\_

Is this a rigid motion? \_\_\_\_\_

Transformation: \_\_\_\_\_

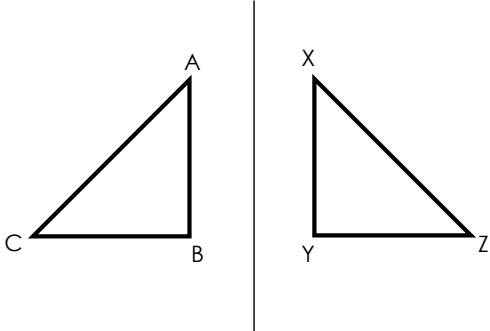

Is this a rigid motion? \_\_\_\_\_

Draw an example of a rigid motion on the coordinate plane to the left.

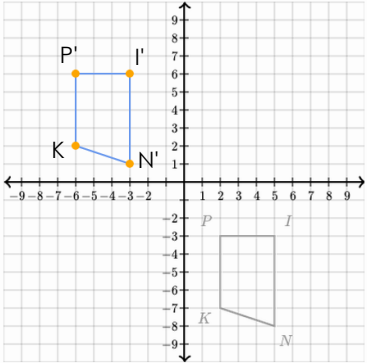

Explain why your example is a rigid motion

# Proving Congruence with Rigid Transformations

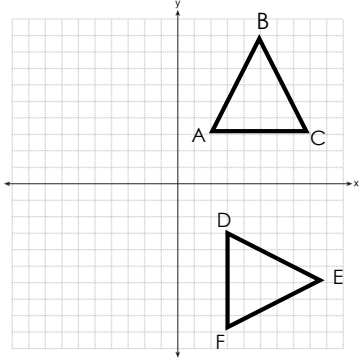

1. State the transformation that maps  $\triangle ABC$  onto  $\triangle XYZ$

2. Use the properties of rigid motions to explain why  $\triangle ABC \cong \triangle XYZ$

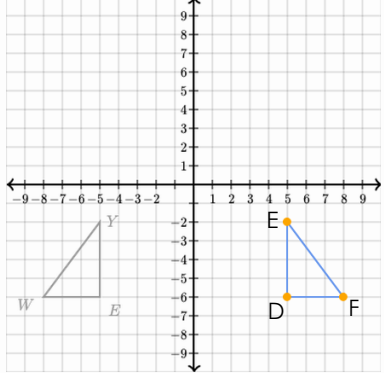

1. State the transformation that maps PINK onto P'I'N'K'

2. Explain why PINK is congruent to P'I'N'K' using the properties of rigid motions.

$\triangle ABC$  and  $\triangle DEF$  are graphed on the coordinate plane. Use the properties of rigid motions to explain why  $\triangle ABC \cong \triangle DEF$

$\triangle YWE$  and  $\triangle DEF$  are graphed on the coordinate plane. Use the properties of rigid motions to explain why  $\triangle YWE \cong \triangle DEF$
